The method employed was substantially modeled after the localized electrization of Duchenne; but the results, though in some instances very decided, were, on the whole, unsatisfactory. But the soothing and invigorating effects of a persevering use of a steady current of induced electricity were so manifest in his own person, and in other cases where it was employed, that he was encouraged to continue his investigations at various intervals, both in hospital and in private practice. The results, however, were still unequal and inconstant, owing partly to the want of a convenient, reliable apparatus, but chiefly to the fact that the applications were too exclusively localized over certain muscles.
